

In my opinion, compelling internet providers to open their networks to easy surveillance by law enforcement will place too much of a financial burden on the providers and ultimately consumers. I do not believe the original CALEA legislation was intended to provide access to this level of technology. Law enforcement should be providing the public with examples and quantities outlining the need for this before any further legislation is considered. Finally, no part of any IP packet communications has been proven to be secure. This type of functionality should only be added if, and only if, it can be completely secured from hackers.
